DATE MAILED: 04/03/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/643,556

Applicant(s)

WOLFE ET AL.

Examiner

Rodney G. McDonald

Art Unit

1753

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 11 January 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-9,11,13-21 and 23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-9,11,13-21 and 23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Allowable Subject Matter

The indicated allowability of claims 1-9, 11, 13-21, 23 is withdrawn in view of the newly discovered reference(s) to Paranjpe et al. (U.S. Pat. 6,572,744), Sellers (U.S. Pat. 5,810,982), Xiong (U.S. Pat. 6,537,428), Akira (Japan 10-079358) and Scobey (U.S. Pat. 5,525,199). Rejections based on the newly cited reference(s) follow.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1, 4, 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. (U.S. Pat. 6,572,744) in view of Sellers (U.S. Pat. 5,810,982).

Art Unit: 1753

Regarding claim 1, Paranjpe et al. teach an apparatus for reactive magnetron sputtering including a vacuum chamber for low pressure sputtering. At least a pulsed DC power source applying a power to a target that is sputtered. An inert gas and a reactive gas can be submitted to the chamber. To improve the quality of the thin film the target should be located at a great distance from the substrate which is known as a long-throw sputtering. (Column 1 lines 15-35, lines 47-50; Column 4 lines 65-68) The pressure can be 2 mTorr or below thus meeting the mean free path requirement. (Column 6 lines 43-56; Column 6 lines 63-66)

Regarding claim 4, Paranjpe et al. teach that the long throw distance can be greater than about 15 inches (i.e. 15 inches to 18 inches). (Column 6 line 49)

Regarding claim 7, Paranjpe et al. the long throw distance is a function of the width/area of the substrate to be coated because it requires the incident angle to be 30 degrees. (Column 6 lines 36-56)

Regarding claim 8, Paranjpe et al. teach that the long throw distance is additionally a function of the number of target sources because a maximum incident angle is required. (Column 6 lines 36-56)

The differences between Paranjpe and the present claims is that the pulsed DC magnetron preventing target poisoning is not discussed (Claim 1) and means for providing a reactant gas at the target source is not discussed (Claim 1).

Regarding the pulsed DC magnetron preventing target poisoning (Claim 1), Sellers teach that dc pulsed sputtering prevents target poisoning. (Column 4 lines 23-32)

Regarding the means for providing a reactant gas at the target source (Claim 1),
Sellers teach providing a means for providing reactant gas at the target source.
(Column 9 lines 62-65)

The motivation for providing a DC pulsed power source and providing a reactant
gas at the target source is that it allows for preventing target poisoning. (Column 4 lines
30-32)

Therefore, it would have been obvious to one of ordinary skill in the art at the
time the invention was made to have modified Paranjpe by utilizing DC pulsed
sputtering and providing a means to provide reactant gas at the target as taught by
Sellers because it allows for preventing target poisoning.

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe
et al. in view of Sellers as applied to claims 1, 4, 7 and 8 above, and further in view of
Xiong et al. (U.S. Pat. 6,537,428).

The difference not yet discussed is where the means for providing the reactant
gas additionally provides an inert gas at the target source. (Claim 2)

Regarding claim 2, Xiong et al. teach providing a reactant gas and inert gas
adjacent a target provided with a DC pulsed power. (See Fig. 1; Column 4 lines 23-25)

The motivation for utilizing a reactant gas and inert gas at the target is that it
allows for reactive producing dielectric coatings. (Column 2 lines 1-12)

Therefore, it would have been obvious to one of ordinary skill in the art at the
time the invention was made to have utilized a means for providing the reactant gas and

additionally providing an inert gas at the target source as taught by Xiong et al. because it allows for producing dielectric coatings.

Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. in view of Sellers as applied to claims 1, 4, 7 and 8 above, and further in view of Akira (Japan 10-079358).

The difference not yet discussed is where the pressure is below 1 mTorr.

Paranjpe et al. already establish sputtering at 2 mTorr or below. (See Paranjpe discussed above) Akira et al. show that reactive sputtering of TiN during long throw sputtering should take place below 1.0 mTorr. (See Abstract) More particularly at 0.3 mTorr. (See Machine translation paragraph 0030)

The motivation for utilizing pressures below 1.0 mTorr is that it allows for forming films with excellent step coverage. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have sputtered below 1.0 mTorr as taught by Akira because it allows for forming films with excellent step coverage.

Claims 5, 6, 9 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. in view of Sellers as applied to claims 1, 4, 7 and 8 above, and further in view of Scobey (U.S. Pat. 5,525,199).

The differences not yet discussed is where the target source is smaller than the width/area of the substrate to be coated (Claim 5), where the target source is smaller than the width/area of the substrate to be coated by at least a factor of three (Claim 6), utilizing a plurality of sources with reactive gas wherein each additional target source

Art Unit: 1753

reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby is not discussed (Claim 9) and utilizing a plurality of sources with inert gas and reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby is not discussed (Claim 11).

Regarding claim 5, Scobey et al. teach in long throw sputtering utilizing a target source that is smaller than the area of the substrate to be coated. (Column 5 lines 62-64; Column 6 lines 15-17)

Regarding claim 6, Scobey et al. teach that in long throw sputtering the target source can be at least a factor of three times smaller than the substrate area. (Column 5 lines 62-64; Column 6 lines 15-17)

Regarding utilizing a plurality of sources with reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby of claim 9, Scobey et al. teach utilizing multiple source for long throw sputtering. (See Figure 5) Sellers discussed above teach utilizing reactive gas at the target surface. (See Sellers discussed above) As to the result of using multiple sources with reactive gas since Sellers combined with Scobey et al. teach the apparatus limitations the process result would be achieved. (i.e. the ratio).

Regarding utilizing a plurality of sources with inert gas and reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby of claim 11, Scobey et al. teach utilizing multiple source for long throw sputtering. (See Figure 5) Sellers discussed above teach utilizing reactive gas at the target surface and inert gas at the target surface. (See Sellers discussed above) As to the result of using multiple sources with reactive gas since Sellers combined with Scobey et al. teach the apparatus limitations the process result would be achieved. (i.e. the ratio).

The motivation for utilizing the features of Scobey et al. is that it allows for producing optical films with high packing densities. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized the features of Scobey et al. because it allows for producing optical films with high packing densities.

Claims 13, 16-21 and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. (U.S. Pat. 6,572,744) in view of Sellers (U.S. Pat. 5,810,982) and Scobey (U.S. Pat. 5,525,199).

Regarding claim 13, Paranjpe et al. teach an apparatus and process for a reactive magnetron sputtering including a vacuum chamber for low pressure sputtering. At least a pulsed DC power source applying a power to a target that is sputtered. An inert gas and a reactive gas can be submitted to the chamber. To improve the quality of the thin film the target should be located at a great distance from the substrate which is

Art Unit: 1753

known as a long-throw sputtering. (Column 1 lines 15-35, lines 47-50; Column 4 lines 65-68) The pressure can be 2 mTorr or below thus meeting the mean free path requirement. (Column 6 lines 43-56; Column 6 lines 63-66)

Regarding claim 16, Paranjpe et al. teach that the long throw distance can be greater than about 15 inches (i.e. 15 inches to 18 inches). (Column 6 line 49)

Regarding claim 19, Paranjpe et al. the long throw distance is a function of the width/area of the substrate to be coated because it requires the incident angle to be 30 degrees. (Column 6 lines 36-56)

Regarding claim 20, Paranjpe et al. teach that the long throw distance is additionally a function of the number of target sources because a maximum incident angle is required. (Column 6 lines 36-56)

The differences between Paranjpe and the present claims is that the pulsed DC magnetron preventing target poisoning is not discussed (Claim 13), means for providing a reactant gas at the target source is not discussed (Claim 13), and coating large scale optics (Claim 13), the target source is smaller than the width/area of the substrate to be coated (Claim 17), where the target source is smaller than the width/area of the substrate to be coated by at least a factor of three (Claim 18), utilizing a plurality of sources with reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby is not discussed (Claim 21) and utilizing a plurality of sources with inert gas and reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of

Art Unit: 1753

every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby is not discussed (Claim 23).

Regarding the pulsed DC magnetron preventing target poisoning (Claim 13), Sellers teach that dc pulsed sputtering prevents target poisoning. (Column 4 lines 23-32)

Regarding the means for providing a reactant gas at the target source (Claim 13), Sellers teach providing a means for providing reactant gas at the target source. (Column 9 lines 62-65)

The motivation for providing a DC pulsed power source and providing a reactant gas at the target source is that it allows for preventing target poisoning. (Column 4 lines 30-32)

Regarding the coating of large scale optics (Claim 13), Scobey et al. teach coating large scale optics. (See Abstract)

Regarding claim 17, Scobey et al. teach in long throw sputtering utilizing a target source that is smaller than the area of the substrate to be coated. (Column 5 lines 62-64; Column 6 lines 15-17)

Regarding claim 18, Scobey et al. teach that in long throw sputtering the target source can be at least a factor of three times smaller than the substrate area. (Column 5 lines 62-64; Column 6 lines 15-17)

Regarding utilizing a plurality of sources with reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase

Art Unit: 1753

in the total ionization provide thereby of claim 21, Scobey et al. teach utilizing multiple source for long throw sputtering. (See Figure 5) Sellers discussed above teach utilizing reactive gas at the target surface. (See Sellers discussed above) As to the result of using multiple sources with reactive gas since Sellers combined with Scobey et al. teach the apparatus limitations the process result would be achieved. (i.e. the ratio).

Regarding utilizing a plurality of sources with inert gas and reactive gas wherein each additional target source reduces the partial pressure of the reactant gas of every target source without a corresponding reduction in the impingement ratio due to the increase in the total ionization provided thereby of claim 23, Scobey et al. teach utilizing multiple source for long throw sputtering. (See Figure 5) Sellers discussed above teach utilizing reactive gas at the target surface and inert gas at the target surface. (See Sellers discussed above) As to the result of using multiple sources with reactive gas since Sellers combined with Scobey et al. teach the apparatus limitations the process result would be achieved. (i.e. the ratio).

The motivation for utilizing the features of Scobey et al. is that it allows for producing optical films with high packing densities. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Paranjpe et al. by utilizing the features of Sellers and the features of Scobey et al. because it allows for preventing target poisoning during sputtering in order to produce optical films with high packing densities.

Art Unit: 1753

Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. in view of Sellers as applied to claims 13 and 16-22 above, and further in view of Xiong et al. (U.S. Pat. 6,537,428).

The difference not yet discussed is where a reactant gas is provided in addition to an inert gas at the target source. (Claim 14)

Regarding claim 14, Xiong et al. teach providing a reactant gas and inert gas adjacent a target provided with a DC pulsed power. (See Fig. 1; Column 4 lines 23-25)

The motivation for utilizing a reactant gas and inert gas at the target is that it allows for reactive producing dielectric coatings. (Column 2 lines 1-12)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have utilized a reactant gas and an inert gas at the target source as taught by Xiong et al. because it allows for producing dielectric coatings.

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paranjpe et al. in view of Sellers as applied to claims 13 and 16-22 above, and further in view of Akira (Japan 10-079358).

The difference not yet discussed is where the pressure is below 1 mTorr.

Paranjpe et al. already establish sputtering at 2 mTorr or below. (See Paranjpe discussed above) Akira et al. show that reactive sputtering of TiN during long throw sputtering should take place below 1.0 mTorr. (See Abstract) More particularly at 0.3 mTorr. (See Machine translation paragraph 0030)

The motivation for utilizing pressures below 1.0 mTorr is that it allows for forming films with excellent step coverage. (See Abstract)

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have sputtered below 1.0 mTorr as taught by Akira because it allows for forming films with excellent step coverage.

Response to Arguments

Applicant's arguments filed 1-11-06 have been fully considered.

As discussed above the allowability of the claims has been withdrawn based on newly cited references. New 35 U.S.C. 103 rejections have been made. The Examiner awaits response to these new rejections.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rodney G. McDonald whose telephone number is 571-272-1340. The examiner can normally be reached on M- Th with Every other Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nam X. Nguyen can be reached on 571-272-1342. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
